Building your market file

> **This is a temporary solution**

Every scenario that reaches stage 3 uses this. One prompt, one file, so there is only one version of it to keep right.

Why you are doing this

Stage 3 of the workflow researches your market. **Your market file is the whole of what it knows about that market**, so anything missing from it cannot be recovered later, and the workflow should record the gap rather than fill it.

The stage 3 opening message says what the file holds and how the stage works. This page does not repeat it.

The prompt below asks for more than the opening message does, on purpose. A card resting on two sources is thin, and a thin card makes a thin market summary and thin solutions after it.

What to do

1. Open **Microsoft Copilot in a browser**. Not the one inside VS Code.
2. Copy the prompt below into it and fill in the three bracketed lines. Change nothing else.
3. Check the result against the list further down, and open every link yourself. The file is final only when every item on that list holds.
4. Save it as `market.md`. Once stage 1 has started your run, put it in the run's `3-competitive-analysis/supplied/` folder, as the only file there, **before you tell the Competitive Analysis agent to begin**. Do not edit it once stage 3 has read it.

Output language is the language your run is in. Scenario 1 runs in Czech, so its file is Czech. The others follow whatever you declare at the start.

Keep the two section headings as the prompt writes them: `## Competitors` and `## Trends`. They are how the file is read. Everything under them can be in Czech.

Do not paste your brief, your interviews or your customer material into Microsoft Copilot. Only the market and the country go in. Anything from your own documents leaves eská spoitelna when you press send.

The prompt

```
I need a market scan that will be handed to a structured analysis process.

It has fixed rules and the output has to meet them exactly.

Market: [describe the product or service area in one line]

Country or region: [e.g. Czech Republic]

Output language: [English or Czech]

FIND 10 ORGANISATIONS active in this market.

Most should be direct or adjacent players. At least two must be substitutes:

something people use instead of this kind of product rather than a direct rival.

For each organisation give me:

- Its name

- Whether it is direct, adjacent or substitute

- A link to its own page about this product or service

- At least five further links, each from a different publisher
```

The link rules are the part that matters:

- Six links minimum per organisation, no two from the same publisher.

A company's own blog and its own product page are one publisher, not two.

- The organisation's own page must be one of them.

- At least three must be the organisation itself, a regulator, a trade body,

a law firm or an industry analyst. Six news sites is not enough.

- Prefer pages that load for anyone: no login, no paywall, no country block.

- List only links you opened in this conversation and saw load. Never list a

link from memory, and never build one from a pattern or a site's structure.

- If you tried a link and it did not open, you may list it, but end its line

with "(did not open)". Never leave such a link unmarked.

- If you cannot reach six different publishers for an organisation, say so

under that entry and leave it short. Do not fill the gap.

THEN FIND 12 TRENDS, four in each of these classes:

- business: how the market or customer behaviour is moving

- technology: what is changing in how this is built or delivered

- regulatory: laws and rules that are changing

For each trend: a short name, one sentence on what is moving, and two links

from different publishers. The link rules above apply to these links too.

For the regulatory ones only, also give:

- The real name of the law, regulation or directive

- The date it applies from, or "date not yet settled" if it is not fixed

FORMAT. Follow this exactly, because it is read by a parser.

Two sections, each a level-two heading:

Competitors

Trends

Keep these two headings in English exactly as written, even when the

output language is Czech.

Every organisation and every trend is a level-three heading under its section.

Nothing else in the file uses a level-three heading. Do NOT group the trends

under class headings — the class goes inside each trend entry, like this:

Competitors

```
### Acme Bank

Type: direct

- https://...https://...</a>

- <a href="https://..." target="_blank" rel="noopener noreferrer" title="https://..." class="fai-ChatInputEntity

Instrument: Regulation (EU) 2024/886

Applies from: 2025-10-09

What is moving: one sentence.

- <a href="https://..." target="_blank" rel="noopener noreferrer" title="https://..." class="fai-
ChatInputEntity__text ___6erqso0 fyind8e f1tx3yz7 f1deo86v f1eh06m1 f1iescvh">https://...</a>

- <a href="https://..." target="_blankery link out in full, exactly as it
```

Before the file is final: every item below holds

Copilot saying it opened a link is not the check. You opening it is.

1	Ten organisations, and at least two of them substitutes
2	Six links each, from six different publishers, one of them the organisation's own page, or a note under the entry saying why it has fewer
3	At least three of those six are the organisation itself, a regulator, a trade body, a law firm or an industry analyst
4	Twelve trends, four in each of the three classes
5	Every trend has two links from different publishers, and each regulatory one names a real law and a date
6	Only ## for the two section headings, `## Competitors` and `## Trends`, and ### for each entry. The trends are not grouped under class headings
7	**You have opened every link in the file yourself**, on the S computer you will test on, and removed each one that did not open, including every line marked "(did not open)". A page that will not open there is unlikely to open for stage 3 either
8	After removing links, every organisation still has links from at least two different publishers, one of them its own site. An organisation with fewer is removed, or kept with a note under its entry saying what is missing. That is the least stage 3 accepts from a file
9	No link, organisation, law or date in the file is one you could not confirm

Where the scan came up short, leave it short and write down which entry. A short list is fine where the sources run out. A padded one looks exactly like a real one and teaches us nothing.

Every organisation in your file gets a card, including one whose pages will not open, so list only organisations you want looked at. Ten is the most stage 3 sets out to profile.

Scenario 4 changes one entry on purpose before the file goes in. Do that only if you are running scenario 4, and only the way its instructions say.
